

AMENDMENTS TO CLAIMS

B1

1. (Currently Amended) ~~Storage-Discharge~~ A charge/discharge device integral with a low impedance current pool structure, for application in a primary cell, or in a secondary rechargeable/dischargeable cell, or still in a fuel cell or in a capacitor or in a super capacitor, similar charging/discharging device, complete with one or more ~~than one~~ current pool means to yield multiple current converging paths, characterized in ~~that by~~ connecting in parallel current confluent terminals as provided in tanks of like polarities, in tanks of unlike polarities but of identical voltage specifications, and those on electrode boards of like polarities, or alternatively in connecting in series or in compound serial/parallel connections current confluent terminals between electrode boards of unlike polarities in tanks of dissimilar electrodes; and in that the exterior sides of the electrode boards of either positive or negative polarity furnished on either side of each individual electrode tank are produced into such a low impedance texture such that it is made advantageous to confluent currents, be it incoming or outgoing pool terminals of identical voltage rating and of electrode boards of like polarities from tanks of like polarities from tanks of dissimilar polarities, or alternatively by series connection or compound serial/parallel connection of current pool terminals way between electrode boards of dissimilar polarities a low impedance structure for input/output current pool is achieved on the exteriority of the positive or negative electrode board on both sides of individually installed electrode tanks.

2. (Currently Amended) ~~Low impedance current pool assembly~~ A charge/discharge device according to claim 1, as integral with said storage/discharge device, wherein low impedance current pool structure further to be is connected into a tank of identical polarity electrodes, or a tank of dissimilar polarity electrodes by means of coupling conductors, whereof said current pool terminals of identical potentials and identical polarity are in parallel, or serving to be connected with current pooling terminals between electrode boards of dissimilar polarities in a tank of dissimilar electrodes, executed in serial connection or compound serial/parallel connection; ~~on the exterior side of the electrode board, of positive or negative polarity, on both sides of the individually installed electrode tank is executed a low impedance current pool structure of any~~

Serial Number 09/884,031

~~chosen geometry to facilitate infeeding/outfeeding of confluent currents, executed in the form of inflowing/effluent pooling terminals, or that incorporated with parallel current pool conductor, or as made from material of better conductivity with a view to reduce the resistance to infeeding/outfeeding confluent currents; structurally it can comprise singly or plurally any or some of the features listed below:~~

- 
- ~~— plate or strip or web form structure for connection to respective output/input current pool terminals T100 of which individual electrode tanks are installed outside the positive or negative polarity electrode board P200, on both sides of the electrode tank, or other low impedance current pool conductor assembly made of chosen materials in otherwise geometrical configurations;~~
 - ~~— plate or strip or web form structure for connection to respective output/input current pool terminals of which individual electrode tanks are installed outside the positive or negative polarity electrode boards on both sides of the electrode tank, with areas between consecutive output current pool terminals interconnected by welding, soldering, riveting or screwing technique, or prestressed, or burial or inlay or otherwise means, to facilitate pooling of input/output currents, or other low impedance current pool conductor assembly of chosen material in otherwise geometrical configuration;~~
 - ~~— plate or strip or web form structure with output/input current pool terminals associated with the overall storage/discharging device being installed outside the positive or negative polarity electrode board on both sides of the electrode tank, to facilitate transiting of incoming/outgoing current pool, or low impedance current pool conductor assembly of chosen material but otherwise geometrical configuration, said plate form encompassing thickened board of uniform or non-uniform, tilted sheets;~~
 - ~~— current pool terminals for input/output purposes secured by soldering, welding, riveting, screwing, prestressing technique or by burial, inlay or otherwise means among themselves, established outside the positive or negative polarity electrode boards on both sides of the electrode tank, led to correspondent terminals on the master storage/Discharge Assembly, in plate or strip or web form to facilitate pooling of~~

~~incoming/outgoing currents, being a low impedance conductive assembly of a chosen geometry or otherwise materials;~~

~~— interconnect pieces or bars of conductors of a chosen geometry and of chosen materials interposed between parallel conductors between sets of input/output current pool terminals on a plurality of electrode boards of like polarities;~~

~~— interconnect pieces or bars of chosen geometry and material incorporated additionally between a plurality of serially parallelly connected conductors on input/output current pool terminals on sets of electrode boards of dissimilar polarities.~~

3. (Currently Amended) ~~Low impedance current pool structure integral with the~~ A storage/discharge device according to claim 1, characterized in that the positive or negative polarity electrode board can be composed of other low impedance materials where needed different from those low impedance structure disclosed in the foregoing in respect of its exteriority, and as part of which the current pool terminals for input/output purposes can be provided singly or plurally, on single side or on more than one side.

4. (Currently Amended) ~~Low impedance current pool structure as dependent on the~~ A storage/discharge device according to claim 1, whereof the design in respect of the improvement of the positive or negative exteriority of the electrode board on both sides of the independently installed electrode tank is thus: having one or more piece of paralleled positive electrode board P100 and as matched thereto, one or more piece of paralleled negative electrode board P100, set in individual electrode tanks to constitute individual electrode pairs, then have flat plate form current pool conductor assembly of chosen material and made to specified thickness installed way between respective current pool terminals on the exteriority of positive or negative electrode board P200 on both sides of each individual electrode tank, so that it is made that the impedance prevalent way between the current pool terminals on the periphery of the external positive or negative electrode board P200 is inferior to that impedance prevailing across the normal electrode surface duly applied with one layer of chemically active material in lattice configurations on the same electrode board.

5. (Currently Amended) ~~Low impedance current pool structure as dependent upon the A~~ storage/discharge device according to claim 1, whereof the exteriority of the external electrode board in respective individual electrode tank is processed into a current pool conductor in the form of a plank lamina or thickened lamina of uniform elements or non-uniform elements processed to present a slope.

6. (Currently Amended) ~~Low impedance current pool structure as dependent upon the A~~ storage/discharge device according to claim 1, whereof the outside of the positive or negative electrode board P200 on both sides of the individual present in the independently installed electrode tank, way between respective current pool terminals T100, is processed straight into webform conductor assembly of chosen thickness.

7. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof in the individual electrode pairs formed in the independently installed electrode tank, way between the current pool terminals outside the positive or negative polarity electrode board P200 on both sides, pieces or webform or stripe form current pool conductor assembly are interconnected by soldering, welding, riveting, screw coupling, prestressed bonding, internal burial, laying or otherwise technique, in order that the impedance prevailing between the current pool terminals T100 on the perimeter of the externally provided positive or negative polarity electrode boards be controlled inferior to the impedance on the normal electrode surface on the other side of the same electrode board that is applied with a lattice work of chemically active coating.

8. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof the said electrode board with plate form terminals on the outside is good for connection to two or more than two independent electrode tanks, and hence good for like polarity on like polarity paralleling or opposite polarity serial connection under the same voltage specifications.

9. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof required on that side of the externally provided plate-form ~~terminalled~~ terminal electrode board meant to couple with current pool terminals coming from other electrode tanks may be mounted two or more than two current pool terminals to thereby account for multiple coupling possibilities so that impedance is lowered in the long run.

10. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof the current conductor assembly outside the positive or negative electrode board P200 on both sides of the individual electrode tank in particular, are provided two current pool terminals T100 to accommodate serial or parallel combination with each electrode tank where multiple sets of electrode tanks are deployed for application.

11. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof with a view to further reduce the impedance on the part of both the current pool terminal and of the electrode board, a feasible approach is to process the current pool terminal trapezoidal extending outwardly, such that the wider base of the trapezoidal current pool terminal is coupled to the electrode board, whereby the internal impedance on the terminal, output or input, of the electrode board, is duly reduced[[]];

examples of application of the aforementioned trapezoidal current pool terminal and electrode boards include: normal electrode boards P100 with both sides applied with latticed chemically active coating, two or more than two outputting or inputting current pool terminal T100 on the outside of the positive or negative polarity electrode board P200 on both sides of each electrode tank, possible for mounting on one side or more sides of the electrode board P100 or the positive or negative electrode board P200, or for one or more current pool terminal to be installed on two or more sides of the electrode board P100 or of the positive or negative polarity electrode board.

12. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof two trapezoidal current pool terminals T100 in the middle of one external side of the positive or negative electrode board P200 on both sides of the individually installed electrode tank, just to make for a correspondent positive or negative electrode pair with the electrode board.

13. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof trapezoidal current pool terminals T100 are provided on both sides of the exteriority of the positive or negative electrode board P200 on both sides of each individual electrode tank, to form electrode pair with electrode board symmetrically.

14. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof on either of both external sides of the positive or negative electrode board P200 on both sides of individual electrode tank are installed two trapezoidal current pool terminals T100, extending outwardly, characterized in that a dimensional differential exists between the hunch peak of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is produced by superposing the backsides of the two similarly configured electrode boards, interwoven superposition is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals T100 intercrossing but not intervening each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

15. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof three externally extending trapezoidal current pool terminals T100 on each external side of the positive or negative polarity electrode board P200 on both sides of the electrode tank, characterized in that a dimensional differential exists between the hunchback of current pool terminals on the same side of the trapezoid and the

Serial Number 09/884,031

edges on both sides of the electrode board, so that once an electrode pair is produced by superposing the backsides of the two similarly configured electrode boards, interwoven superposition is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals T100 intercrossing but not intervening each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

16. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof an outwardly extending trapezoidal current pool terminal T100 on two opposite sides of a quadrilateral positive or negative electrode board P200 on both sides of individually installed electrode tank, characterized in that a dimensional differential is maintained between the hunch peak of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is formed by superposing the backsides of the two similarly configured electrode boards, interwoven super-positions is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals T100 intercrossing but not intervening each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

17. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof two outwardly extending trapezoidal current pool terminals T100 on two opposite sides of a quadrilateral positive or negative electrode board P200 on both sides of individually installed electrode tank, characterized in that a dimensional differential is maintained between the hunch peak of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is formed by superposing the backsides of the two similarly configured electrode boards, interwoven super-positions is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals T100 intercrossing but not intervening

each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

18. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof three outwardly extending trapezoidal current pool terminals T100 on two opposite sides of a quadrilateral positive or negative electrode board P200 on both sides of individually installed electrode tank, characterized in that a dimensional differential is maintained between the hunch peak of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is created by superposing the backsides of the two similarly arrayed electrode boards, interwoven superposition is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals P100 intercrossing but not intervening each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

19. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof an outwardly extending trapezoidal current pool terminal T100 on two opposite sides of a quadrilateral positive or negative electrode board P200 on both sides of individually installed electrode tank, characterized in that a dimensional differential is maintained between the hunch back of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is created by superposing the backsides of the two similarly configured electrode boards, interwoven superposition is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals P100 intercrossing but not interfering each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

20. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof two outwardly extending trapezoidal

current pool terminals T100 on two opposite sides of a quadrilateral positive or negative electrode board P200 on both sides of individually installed electrode tank, characterized in that a dimensional differential is maintained between the hunch back of current pool terminals on the same sides of the trapezoid and the edges on both sides of the electrode board so that once an electrode pair is created by superposing the backsides of the two similarly configured electrode boards, interwoven superposition is made involving the positive/negative polarity electrodes of adjacent electrode boards, with current pool terminals P100 intercrossing but not interfering with each other, so as to facilitate interactive coupling, with better current pooling effects realized on the basal area of the wider trapezoid.

21. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof in its application to quadrilateral or nearly quadrilateral electrode boards, apart from the provision of current pool terminals on two or four sides, it is also feasible to provide current pool terminals on three sides of the electrode board too, and the configuration of said electrode board is not restricted to a quadrilateral only, indeed it can instead take the form of a circle, a near circle, an ellipse, a near ellipse, a triangle, a polylateral, including without limitation: triangle, quadrilateral, quintuple lateral, hexagon, septuple lateral, octuple lateral, with each electrode board furnished with two or more than two current pool terminals so that each electrode board is equipped with two or more than two current pooling loops.

22. (Canceled)

23. (Currently Amended) ~~Low impedance current pool structure as part of the A~~ storage/discharge device according to claim 1, whereof apart from the input/output current pool terminals on the positive, negative electrode boards on both sides of the electrode tank which, as required, may be installed singly or plurally, on one side or on more sides, all the other electrode boards can be structured such that one or more current pool terminal individually extending outwards are installed on two or more than two sides on individual electrode boards;

or such that two or more than two current pool terminals are all installed on just one side or more sides, to enable multiple current path paralleling converged on electrode boards of like polarities, or instead multiple path series connection between electrode boards of dissimilar polarities; structurally, the current pool terminals are made of hardcore or hollow-set tubular rod conductors bearing circular, square, otherwise geometric configurations, to be mounted into position across the conductive penetration holes present way between the electrode boards of the storage/discharge device, so that parallel connection is made possible with electrode boards of like polarities, or alternatively serial connection is made among electrode boards of dissimilar polarities, so still so that a combined serial/parallel connection is consummated: further parallel execution is extended to encompass the current pool terminals, being conductor themselves, such that they, of identical voltage specifications and on electrode boards of like polarities, from the same or different electrode tanks, the extension goes to series connection too, by interconnecting current pool terminals between electrode boards of different polarities from dissimilar electrode tanks serially and hence compound serial/parallel combination is made possible forthwith, and that complemented with the effort of a low impedance structure whereby input/output current pool terminals are combined to facilitate pooling of incoming/outgoing currents, on the exteriority of positive or negative electrode boards on both sides of individually installed electrode tanks, or alternatively supplemented with parallel run current pool conductors in an effort to reduce impedance to the confluent incoming or outgoing currents.

24. (New) A charge/Discharge Device according to claim 1, wherein low impedance current pool conductive structure includes plate or strip or web form structure for connection to respective output/input current pool terminals T100 of which individual electrode tanks are installed outside the positive or negative polarity electrode board P200, on both sides of the electrode tank, or other low impedance current pool conductor assembly made of chosen materials in otherwise geometrical configurations.

25. (New) A charge/discharge device according to claim 1, wherein low impedance current pool conductive structure includes plate or strip or web form structure for connection to respective

Serial Number 09/884,031

output/input current pool terminals of which individual electrode tanks are installed outside the positive or negative polarity electrode boards on both sides of the electrode tank, with areas between consecutive output current pool terminals interconnected by welding, soldering, riveting or screwing technique, or prestressed, or burial or inlay or otherwise means, to facilitate pooling of input/output currents, or other low impedance current pool conductor assembly of chosen material in otherwise geometrical configuration.

26. (New) A charge/discharge device according to claim 1, wherein low impedance current pool conductive structure includes plate or strip or web form structure with output/input current pool terminals associated with the overall storage/discharging device being installed outside the positive or negative polarity electrode board on both sides of the electrode tank, to facilitate transiting of incoming/outgoing current pool, or low impedance current pool conductor assembly of chosen material but otherwise geometrical configuration, said plate form encompassing thickened board of uniform or non-uniform, tilted sheets.

27. (New) A charge/discharge device according to claim 1, wherein low impedance current pool conductive structure includes current pool terminals for input/output purposes secured by soldering, welding, riveting, screwing, prestressing technique or by burial, inlay or otherwise means among themselves, established outside the positive or negative polarity electrode boards on both sides of the electrode tank, led to correspondent terminals on the master storage/Discharge Assembly, in plate or strip or web form to facilitate pooling of incoming/outgoing currents, being a low impedance conductive assembly of a chosen geometry or otherwise materials.

28. (New) A charge/discharge device according to claim 1, wherein low impedance current pool conductive structure includes interconnect pieces or bars of conductors of a chosen geometry and of chosen materials interposed between parallel conductors between sets of input/output current pool terminals on a plurality of electrode boards of like polarities.

Serial Number 09/884,031

29. (New) A charge/discharge device according to claim 1, wherein low impedance current pool conductive structure includes interconnect pieces or bars of chosen geometry and material incorporated additionally between a plurality of serially parallelly connected conductors on input/output current pool terminals on sets of electrode boards of dissimilar polarities.
